

Human Intelligence Enhanced by Artificial Intelligence

A REVOLUTION IN CARDIOVASCULAR IDENTIFICATION AND MANAGEMENT

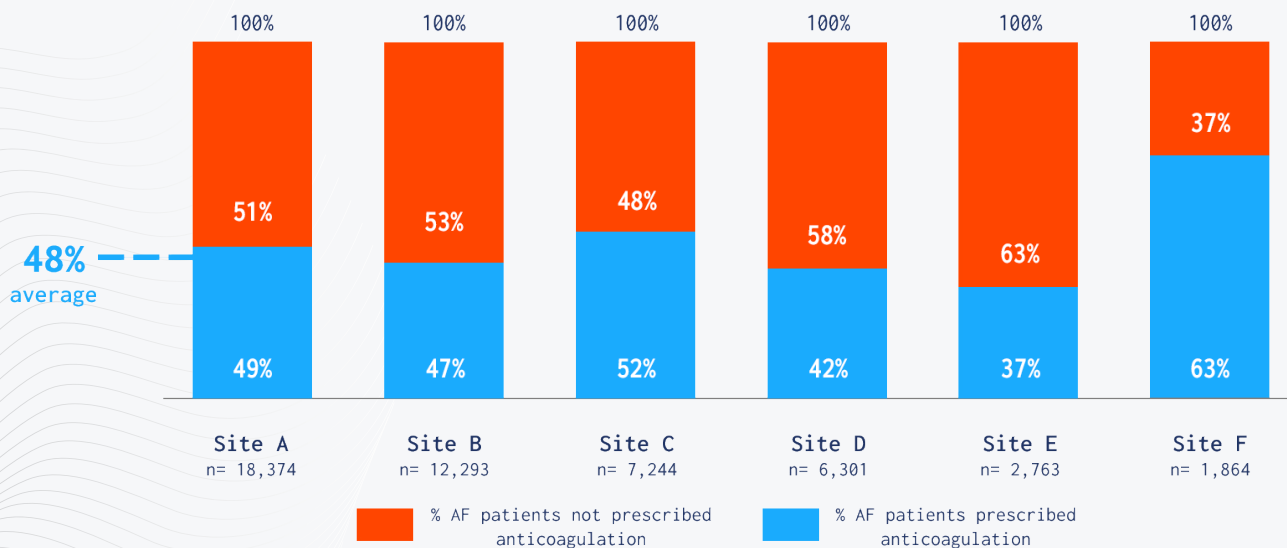

CardioCare

Digital Health Platform

The CardioCare platform identifies at-risk patients with atrial fibrillation (AF) who could benefit from guideline-directed medical therapy (GDMT).

OVER HALF OF POTENTIALLY ELIGIBLE PATIENTS WITH AF WERE NOT PRESCRIBED ANTICOAGULATION^{1,2}

¹Analysis from egnite's database of sites participating in the CardioCare platform representing 154,630 AF patients from 6 institutions (both teaching and non-teaching included). Analysis included patients with an elevated CHA₂DS₂-VASc score (≥ 2 for men and ≥ 3 for women), who are considered potentially eligible for oral anticoagulation per the 2019 AHA/ACC/HRS guidelines for AF. Anticoagulant therapy decisions should include shared decision making and assessment of relative or absolute contraindications/comorbidities for each patient.

²Patients included in this analysis all received an initial recorded diagnosis of AF associated with a hospitalization or an emergency room visit. Patients were considered to have been prescribed anticoagulation if anticoagulation was prescribed prior to or within 30 days of that initial recorded diagnosis. Patients were categorized as not prescribed anticoagulation if there was no record of an anticoagulation prescription, or an anticoagulation prescription was issued greater than 365 days after initial diagnosis.

DELIVERING ON-DEMAND INSIGHTS OF YOUR AF PATIENT POPULATION TO REDUCE VARIABILITY IN CARE & HELP ENSURE GDMT

The CardioCare platform provides insights to help you increase survival for your atrial fibrillation patients.

Automatically identify AF patients who are not receiving anticoagulation.

Guide facility- and MD-level outreach for patient evaluation and follow-up.

Ensure eligible AF patients with multiple hospitalizations receive appropriate GDMT.
